5 Steps to Organize an Event

This app will guide the user into creating an event. The end result would be to send an e-mail with the event information.

The five steps are:
1. Set the event title
2. Set the event location
3. Set the event poster
4. Set the event agenda
5. Send invite by mail

As target audience, there are no constraints. Anyone can organize an event, either a birthday party or a tech event.

The idea came because of the need to organize an event in the next weeks and the best outcome would be that in the end the event would be posted on G+, Facebook and send by email. I will send the email by the end and have a look into creating G+ and Facebook events. For those I might need API access which is not covered in this course.
